

## ABSTRACT

A multi-page key card pamphlet is suitable for use with conventional electronic locks, and replaces the conventional one-piece key card having only two sides. The 5 multi-page format provides additional space for printed material, while still being suitable for use in a conventional electronic lock. A programmable medium, such as for example a magnetic stripe or an integrated circuit device suitable for use on a Smart Card is located on one surface of the key card pamphlet. The multi-page key card pamphlet can be fabricated by folding a sheet having a thickness less than that of a conventional key 10 card. A two panel key card thus contains twice as much space for printed matter as a conventional key card, and printed matter can be included on inside pages or surfaces as well as on the exterior of the key card.
